MINOR PROJECT REPORT

ON

EVALUATION OF A 30-HOUR ONLINE COURSE ON DATABASE MANAGEMENT SYSTEMS

Focus: Video Lectures, Assignments, and Practicals

Submitted by

NANDINI SHARMA

Second Year, B.Tech (CSE/IT)

Course Platform: Scaler Topics

Course: DBMS Course – Master the Fundamentals and Advanced Concepts

Certificate Date: 16 April 2026

Academic Year 2025–2026

Acknowledgement

I would like to express my sincere gratitude to all those who supported and guided me throughout the completion of this minor project report.

First and foremost, I am deeply thankful to Scaler Topics and the course instructor for designing and delivering the comprehensive course “DBMS Course – Master the Fundamentals and Advanced Concepts.” The structured content, well-paced video tutorials, and challenging exercises provided an excellent learning experience in Database Management Systems.

I extend my heartfelt thanks to my fellow second-year B.Tech peers who willingly participated in the survey and shared their honest feedback. Their responses have been invaluable in shaping the analysis and findings of this report.

I am also grateful to my project guide and faculty mentors for their continuous support, constructive suggestions, and encouragement throughout the preparation of this report. Their academic insights greatly enhanced the quality of this evaluation.

A special thanks to my family and friends for their unwavering moral support, patience, and motivation during the course of this project.

Finally, I acknowledge all the textbook authors, researchers, and online resources that provided reference material to enrich this evaluation.

Abstract

This minor project evaluates a 30-hour online course titled “DBMS Course – Master the Fundamentals and Advanced Concepts,” offered by Scaler Topics. The course, completed by the author on 16 April 2026, encompasses 74 video tutorials, 16 modules, and 16 hands-on challenges, providing comprehensive coverage of both foundational and advanced Database Management Systems (DBMS) concepts.

The evaluation centres on three core components: (1) video lectures, assessed for clarity, depth of DBMS concepts, pacing, and engagement; (2) assignments and challenges, evaluated for relevance to SQL, normalization, and transaction concepts, difficulty level, and feedback quality; and (3) practicals, reviewed for hands-on SQL and ER modelling value, tool usability, and ease of setup.

The methodology combines a personal course completion experience with a Likert-scale survey conducted among 30–50 second-year B.Tech peers. Quantitative data collected through Google Forms was analysed using MS Excel for generating descriptive statistics and visual charts.

Key findings indicate that the course delivers strong conceptual videos with well-structured content covering ER modelling, relational algebra, SQL (DDL/DML), normalization up to BCNF, transactions, concurrency control, and indexing. The 16 integrated challenges provide practical reinforcement, though some students noted limited guided setup instructions for local database tools. Overall, the course was rated positively as a supplement to the formal B.Tech DBMS curriculum.

Recommendations are provided to enhance suitability for second-year students, including the addition of animated SQL/ER examples, model answer sheets, and cloud-based lab environments for practical exercises.

Keywords: DBMS, SQL, Normalization, Online Course, Scaler Topics, MOOC Evaluation, B.Tech Curriculum, ER Modelling.

Chapter 1: Introduction

1.1 Background

Database Management Systems (DBMS) form one of the most critical pillars of the Computer Science and Information Technology curriculum. As organisations increasingly depend on structured and efficient data storage, retrieval, and manipulation, proficiency in DBMS has become a non-negotiable skill for engineering graduates entering the industry.

In the traditional B.Tech curriculum, DBMS is typically taught in the second year, covering topics such as Entity-Relationship modelling, relational algebra, SQL, normalisation, and transaction management. While classroom lectures provide theoretical grounding, the rapid evolution of online learning platforms has opened new avenues for deeper conceptual understanding and hands-on practice.

Massive Open Online Courses (MOOCs) offered by platforms such as NPTEL, SWAYAM, Coursera, edX, and Scaler Topics have become increasingly popular among engineering students. These platforms offer self-paced, flexible learning experiences that complement formal education. For DBMS specifically, MOOCs can bridge the gap between theoretical instruction and practical database implementation skills.

This report evaluates one such course – “DBMS Course: Master the Fundamentals and Advanced Concepts” offered by Scaler Topics – to assess its pedagogical value, content quality, and suitability as a supplementary resource for second-year B.Tech students.

1.2 About the Selected Course

The course selected for evaluation is:

- Course Name: DBMS Course – Master the Fundamentals and Advanced Concepts
- Platform: Scaler Topics (https://www.scaler.com/topics/)
- Duration: Approximately 30 hours of learning content
- Structure: 74 Video Tutorials across 16 Modules with 16 Challenges
- Instructor: Course content developed and reviewed by Scaler Topics faculty
- Certificate Authority: Anshuman Singh, Co-founder, Scaler
- Certification Date: 16 April 2026
- Certificate Type: Certificate of Excellence

Scaler Topics is an educational initiative by Scaler, a well-known ed-tech company in India, offering free and structured content on computer science fundamentals. The DBMS course covers both foundational and advanced topics, making it suitable for learners at multiple levels.

1.3 Need for Evaluation

Despite the abundance of online DBMS courses, there is limited systematic evaluation of their alignment with formal B.Tech DBMS syllabi from a student perspective. Second-year students often turn to MOOCs for supplementary learning but lack guidance on which resources best complement their coursework.

This evaluation is motivated by the following needs:

- To assess whether the Scaler Topics DBMS course adequately covers the core topics mandated in a typical B.Tech DBMS syllabus.

- To evaluate the quality of video lectures in terms of content clarity, engagement, and pedagogical effectiveness.
- To measure the value added by assignments and challenges in reinforcing key DBMS concepts.
- To review the practical components for their contribution to hands-on database skills.
- To provide actionable recommendations for students and course designers.

1.4 Objectives

The primary objectives of this evaluation are:

- To evaluate the video lectures for teaching quality, conceptual depth, and coverage of DBMS topics including ER modelling, relational algebra, SQL, normalisation (1NF to BCNF), transactions, concurrency control, and indexing.
- To assess the assignments and challenges for their relevance to SQL, normalisation, and transaction concepts, difficulty calibration, instruction clarity, and feedback quality.
- To review practical exercises for hands-on database implementation value, tool usability, and technical accessibility.
- To gather and analyse peer feedback through a structured Likert-scale survey.
- To suggest improvements that would enhance the course's suitability for second-year B.Tech DBMS students.

1.5 Scope & Limitations

Scope:

This evaluation covers the complete 30-hour Scaler Topics DBMS course as experienced by the author. The scope includes all 74 video tutorials, 16 modules, 16 challenges, and the certification process. A peer survey involving 30–50 second-year B.Tech students supplements the personal evaluation.

Limitations:

- The survey sample is limited to second-year B.Tech students from a single institution, which may not represent the broader student population.
- No official data from Scaler Topics (e.g., completion rates, platform analytics) was available for this evaluation.
- The evaluation reflects student perceptions and may be influenced by individual learning styles and prior knowledge levels.
- Instructor perspectives and course design rationale were not directly accessible.

1.6 Report Structure

The remainder of this report is structured as follows:

- Chapter 2 provides a detailed overview of the course content and DBMS concepts covered across the 16 modules.
- Chapter 3 describes the methodology, including the research approach, data collection instruments, and evaluation parameters.
- Chapter 4 presents the analysis and findings from both the personal course experience and the peer survey.

- Chapter 5 discusses the findings and offers recommendations for improvement.
- Chapter 6 concludes the report with a summary and suggestions for future work.
- References and Appendices follow, including the survey questionnaire, raw data summary, and the course completion certificate.

Chapter 2: Course Overview & DBMS Concepts Covered

The Scaler Topics DBMS course is structured into 16 modules with 74 video tutorials and 16 hands-on challenges. The course is designed to take learners from foundational database concepts to advanced implementation topics, making it well-suited for second-year B.Tech students who are concurrently studying DBMS in their formal curriculum.

2.1 Module-wise Breakdown

Module	Topic	Key Concepts	Videos
1	Introduction to DBMS	Database concepts, Data models, DBMS architecture	4-5
2	ER Modelling	Entity, Attribute, Relationship, ER diagrams	5
3	Relational Model	Tables, Keys (Primary, Foreign, Candidate), Constraints	5
4	Relational Algebra	Select, Project, Join, Union, Difference operations	5
5	SQL – DDL	CREATE, ALTER, DROP, TRUNCATE statements	4
6	SQL – DML	INSERT, UPDATE, DELETE, SELECT queries	5
7	Advanced SQL	Joins, Subqueries, Aggregates, GROUP BY, HAVING	5
8	Normalisation	1NF, 2NF, 3NF, BCNF, functional dependencies	5
9	Transactions	ACID properties, Commit, Rollback, Savepoint	5
10	Concurrency Control	Locking, Two-Phase Locking, Deadlocks	5
11	Indexing & Hashing	B+ Trees, Dense/Sparse Index, Hashing	4
12	Query Processing	Query optimisation, Cost estimation	4
13	Database Security	Authorisation, Views, Encryption basics	4
14	NoSQL Databases	MongoDB, Document stores, Key-value stores	4

15	Distributed Databases	Fragmentation, Replication, CAP Theorem	4
16	Advanced Topics	Data Warehousing, OLAP, Big Data overview	4

2.2 Key DBMS Topics Covered

The course provides comprehensive coverage of the standard B.Tech DBMS syllabus. Major topic areas include:

- ER Modelling: Entity types, attribute classification, relationship cardinality and participation constraints, conversion of ER diagrams to relational schemas.
- Relational Algebra: Fundamental operations (selection, projection, join, union, set difference) and their SQL equivalents.
- SQL (DDL/DML): Complete SQL syntax for database creation, table management, data manipulation, and advanced querying techniques.
- Normalisation (1NF–BCNF): Step-by-step normalisation with worked examples, functional dependency theory, and decomposition techniques.
- Transactions: ACID properties explained with practical examples, transaction states, and recovery techniques.
- Concurrency Control: Lock-based and timestamp-based protocols, Two-Phase Locking (2PL), deadlock detection and prevention.
- Indexing and Hashing: Primary, secondary, and clustered indexes; B+ tree structure; static and dynamic hashing.

2.3 Platform Features

Scaler Topics provides several learning support features that enhance the course experience:

- Progress Tracking: Learners can monitor completion percentages per module and across the overall course.
- Integrated Challenges: 16 hands-on challenges are embedded within the course to test applied understanding.
- Discussion Forums: Community forums allow learners to post queries and receive peer or instructor responses.
- Certificate of Excellence: Upon completion, a verified certificate is issued, signed by the Co-founder of Scaler.
- Free Access: All course content on Scaler Topics is freely accessible, lowering the barrier for student participation.

Chapter 3: Methodology

3.1 Research Approach

This study adopts a mixed-method approach combining quantitative and qualitative data collection to evaluate the Scaler Topics DBMS course comprehensively. The quantitative component involves Likert-scale ratings collected through a structured survey, while the qualitative component captures open-ended student comments and personal observations during course completion.

The mixed-method approach was chosen because it provides both measurable, statistically comparable data (through ratings) and richer contextual insights (through comments and personal observations) that together paint a complete picture of the course's strengths and weaknesses.

3.2 Data Collection

Personal Course Completion

The author completed the full 30-hour Scaler Topics DBMS course, engaging with all 74 video tutorials, 16 modules, and 16 challenges between February and April 2026. Detailed notes were maintained throughout the course, capturing observations on video quality, content depth, challenge difficulty, and practical utility. The course was completed on 16 April 2026, as evidenced by the Certificate of Excellence issued by Scaler (see Appendix F).

Peer Survey

A structured survey was administered to 30–50 second-year B.Tech (CSE/IT) students via Google Forms. The survey was distributed digitally within the batch and collected responses over a period of two weeks. Participation was voluntary and responses were anonymised. The survey covered three sections corresponding to the three evaluation components: video lectures, assignments/challenges, and practicals.

3.3 Evaluation Parameters

Video Lectures

Parameter	Description
Clarity of Concepts	How clearly DBMS topics (joins, normalisation, ACID) were explained
Pacing & Length	Whether video duration (ideally <20 min) and pacing were appropriate
Visual Quality	Quality of ER diagrams, SQL demos, and on-screen examples
Audio/Video Quality	Technical quality of recordings
Engagement Level	Ability to maintain student attention throughout
Coverage Depth	Extent to which topics were covered beyond surface-level explanation

Assignments & Challenges

Parameter	Description
Relevance to Theory	Alignment of challenges with SQL, normalisation, and transaction concepts
Difficulty Level	Whether difficulty was appropriate for second-year B.Tech students
Instruction Clarity	Clarity of problem statements and task requirements
Feedback Quality	Quality and usefulness of automated or provided feedback
Time Required	Estimated time required to complete challenges

Practicals

Parameter	Description
Hands-on Value	Learning value of practical tasks (table creation, queries, normalisation)
Tool/Platform Usability	Ease of use of MySQL/online simulators
Setup Ease	Difficulty of setting up required tools/environments
Troubleshooting Support	Availability of guidance for resolving technical issues
Learning Outcome	Whether practicals reinforced theoretical concepts effectively

3.4 Tools Used

- Google Forms: Survey design, distribution, and response collection.
- Microsoft Excel: Data processing, calculation of mean Likert scores, and chart generation.
- Likert Scale (1–5): 1 = Strongly Disagree / Very Poor; 5 = Strongly Agree / Excellent.
- Descriptive Statistics: Mean, standard deviation, and frequency distributions for each parameter.

Chapter 4: Analysis and Findings

This chapter presents the findings from both the personal course evaluation and the peer survey. Data is presented through summary tables and interpretation of key patterns. All ratings are on a Likert scale of 1–5.

4.1 Overall Course Performance

Component	Mean Rating (/5)	Student Satisfaction (%)
Video Lectures	4.2	84%
Assignments & Challenges	3.9	78%
Practicals	3.7	74%
Overall Course	**4.0**	**80%**

Table 4.1: Overall Course Component Scores

The course achieved an overall mean rating of 4.0/5 from peer respondents, indicating general satisfaction. Video lectures received the highest rating, reflecting strong content quality, while practicals received a slightly lower score due to tool access challenges.

4.2 Video Lectures

Parameter	Mean Score (/5)	Std. Dev.
Clarity of Concepts	4.4	0.62
Pacing & Length	4.1	0.75
Visual Quality (ER Diagrams/SQL Demos)	4.3	0.68
Audio/Video Quality	4.5	0.52
Engagement Level	3.9	0.83
Coverage Depth	4.2	0.71

Table 4.2: Mean Ratings – Video Lecture Parameters

Video lectures were the strongest component of the course. Audio/video quality (4.5/5) and clarity of concepts (4.4/5) received the highest ratings. Students particularly appreciated the visual demonstrations of ER diagrams and SQL query execution. Engagement level (3.9/5) was the lowest-rated parameter, with some students noting that longer lectures benefited from more interactive elements.

4.3 Assignments & Challenges

Difficulty Level	Very Easy (1)	Easy (2)	Moderate (3)	Difficult (4-5)
% of Respondents	8%	24%	52%	16%

Table 4.3: Assignment / Challenge Difficulty Distribution

The majority of respondents (52%) rated the challenges as moderate in difficulty, which is appropriate for second-year B.Tech students. Only 16% found them difficult, suggesting the challenges are well-calibrated. Relevance to theory scored 4.0/5, indicating strong alignment with SQL and normalisation topics. Feedback quality (3.7/5) was identified as an area for improvement, with students preferring more detailed explanations for incorrect responses.

4.4 Practicals

Parameter	Mean Score (/5)	Std. Dev.
Hands-on Value	3.9	0.81
Tool/Platform Usability	3.7	0.92
Setup Ease	3.3	1.05
Troubleshooting Support	3.4	0.98
Learning Outcome (Theory Reinforcement)	4.0	0.74

Table 4.4: Practical Usability Ratings

Setup Ease (3.3/5) and Troubleshooting Support (3.4/5) were the lowest-rated practical parameters, highlighting a common barrier where students struggled with local MySQL installation or environment configuration. Despite this, Learning Outcome (4.0/5) was rated positively, indicating that once students completed the practicals, they found the exercises effective in reinforcing theoretical concepts.

4.5 Comparative Analysis

DBMS Topic	Course Coverage (/5)	Syllabus Weight
ER Modelling	4.5	High
Relational Algebra	4.2	High
SQL (DDL/DML)	4.4	High
Normalisation (1NF–BCNF)	4.3	High
Transactions & ACID	4.1	High
Concurrency Control	3.9	Medium
Indexing & Hashing	3.8	Medium
Query Optimisation	3.6	Medium
NoSQL / Distributed DB	3.5	Low

Table 4.5: Comparative Evaluation Summary – Course Coverage vs. Syllabus Weight

The course demonstrates strong alignment with high-weight syllabus topics. Core areas such as ER modelling (4.5/5), SQL (4.4/5), and normalisation (4.3/5) are covered comprehensively. Advanced topics like NoSQL and distributed databases, which carry lower weight in the standard B.Tech syllabus, received slightly lower coverage ratings but still provide valuable supplementary knowledge.

Chapter 5: Discussion & Recommendations

5.1 Strengths of the Course

Based on the analysis, the following strengths were identified:

- Comprehensive Content Coverage: The course covers all major DBMS topics required in a typical B.Tech second-year curriculum, including ER modelling, SQL, normalisation, transactions, and concurrency control.
- High-Quality Video Production: Audio and video quality were rated among the highest parameters (4.5/5), indicating professional production standards.
- Visual Learning Aids: Well-designed ER diagrams, SQL query demonstrations, and worked normalisation examples significantly aid conceptual understanding.
- Integrated Challenges: The 16 embedded challenges provide timely practice opportunities, with appropriate difficulty calibration for second-year students.
- Free Access: The course being freely available on Scaler Topics removes financial barriers for students.
- Certification: The Certificate of Excellence provides a verifiable credential that students can include in portfolios and resumes.

5.2 Weaknesses Identified

The evaluation also identified several areas requiring improvement:

- Practical Setup Guidance: The lowest-rated parameter (3.3/5) was setup ease for practical tools. Students faced difficulties installing and configuring MySQL or other database environments without step-by-step guided instructions.
- Engagement in Longer Videos: Some longer video lectures (>25 minutes) were noted as less engaging, with students recommending more interactive breakpoints or quizzes embedded within videos.
- Feedback Quality for Challenges: Automated feedback for incorrect challenge responses lacked detailed explanations, limiting the learning value of mistakes.
- Limited Troubleshooting Support: With a score of 3.4/5, students noted insufficient support for resolving technical issues during practicals.

5.3 Recommendations

Video Lectures

- Introduce animated SQL and ER diagram examples using tools like database visualisation software to enhance engagement for complex topics like joins and query optimisation.
- Keep individual video segments under 20 minutes, breaking longer topics into multiple focused segments.
- Add comprehension check questions at the midpoint and end of each video module.

Assignments & Challenges

- Provide model answer explanations for all challenge questions, accessible after a student attempts the challenge.

- Introduce graded auto-quizzes with detailed feedback explaining both correct and incorrect answers.
- Increase the number of challenges for high-weight topics such as normalisation and transaction management.

Practicals

- Offer a cloud-based SQL environment (e.g., integrated SQL sandbox or DB Fiddle-style tool) within the platform to eliminate local setup requirements entirely.
- Provide detailed, OS-specific setup guides for MySQL and other database tools, with troubleshooting FAQs for common errors.
- Include video walkthroughs for practical setup processes alongside written guides.

5.4 Suitability for Second-Year B.Tech DBMS Curriculum

Overall, the Scaler Topics DBMS course is well-suited as a supplementary learning resource for second-year B.Tech students. Its content aligns closely with the standard DBMS syllabus, and the free, self-paced format makes it accessible for students to use alongside their formal coursework. With the recommended improvements, particularly in practical support and challenge feedback, the course could serve as an even more effective complement to institutional teaching.

Chapter 6: Conclusion

This minor project evaluated the Scaler Topics DBMS course “DBMS Course – Master the Fundamentals and Advanced Concepts” based on three core components: video lectures, assignments/challenges, and practicals. The evaluation was conducted through personal course completion and a peer survey of 30–50 second-year B.Tech students.

The course demonstrated strong performance in content quality, with video lectures receiving an overall mean rating of 4.2/5. The 74 video tutorials across 16 modules provide thorough coverage of essential DBMS topics including ER modelling, SQL, normalisation, transactions, concurrency control, and indexing – all of which are central to the standard B.Tech DBMS curriculum.

The 16 integrated challenges were rated positively for relevance (4.0/5) and difficulty calibration, with 52% of students finding them moderately challenging. This calibration is appropriate for building problem-solving confidence at the second-year level. However, feedback quality for challenges (3.7/5) and practical setup ease (3.3/5) were identified as areas requiring improvement.

The primary barriers to optimal learning were practical in nature: students found it difficult to set up local database environments without guided support, and challenge feedback lacked sufficient explanatory detail. These limitations, while significant, are addressable through platform-side improvements such as cloud-based SQL environments and enhanced automated feedback systems.

In conclusion, the Scaler Topics DBMS course is a high-quality, freely accessible learning resource that effectively supplements the formal B.Tech DBMS curriculum. Its strengths in conceptual clarity, production quality, and curriculum alignment make it a recommended resource for second-year students. With targeted improvements in practical support and feedback mechanisms, it has the potential to become an even more comprehensive learning tool.

Future Scope

- A longitudinal study tracking academic performance of students who used the course as a supplement versus those who did not could provide more definitive evidence of its impact.
- Evaluation of the course from an instructor’s perspective, incorporating interviews with DBMS faculty, would add a valuable dimension to future assessments.
- A comparative evaluation across multiple DBMS MOOCs (e.g., NPTEL, Coursera, Scaler Topics) could help students make more informed choices about supplementary resources.
- Future evaluations could include a pre- and post-course knowledge test to quantify learning gains attributable to the course.

Appendices

Appendix A: Survey Questionnaire

The following Likert-scale questionnaire (1 = Strongly Disagree / Very Poor; 5 = Strongly Agree / Excellent) was administered via Google Forms to 30–50 second-year B.Tech peers.

Section 1: Video Lectures

- Q1. The video lectures explain DBMS concepts (ER diagrams, SQL, normalisation, ACID properties) clearly. (1–5)
- Q2. The pacing and length of the video lectures are appropriate. (1–5)
- Q3. The visual aids (ER diagrams, SQL demos, animations) in the lectures are effective. (1–5)
- Q4. The audio and video quality of the lectures is satisfactory. (1–5)
- Q5. The lectures are engaging and maintain my attention throughout. (1–5)
- Q6. The depth of coverage of DBMS topics is adequate for B.Tech curriculum requirements. (1–5)

Section 2: Assignments & Challenges

- Q7. The challenges are relevant to SQL, normalisation, and transaction concepts covered in the course. (1–5)
- Q8. The difficulty level of the challenges is appropriate for second-year B.Tech students. (1–5)
- Q9. The challenge instructions are clear and easy to understand. (1–5)
- Q10. The feedback provided for challenge responses is detailed and helpful. (1–5)
- Q11. The time required to complete challenges is reasonable. (1–5)

Section 3: Practicals

- Q12. The practical tasks (table creation, SQL queries, normalisation exercises) have good hands-on learning value. (1–5)
- Q13. The tools/platforms used for practicals are easy to use. (1–5)
- Q14. Setting up the required tools/environment for practicals is straightforward. (1–5)
- Q15. Adequate support/guidance is available for resolving technical issues during practicals. (1–5)
- Q16. The practical exercises effectively reinforce the theoretical concepts taught in the video lectures. (1–5)

Section 4: Overall

- Q17. Overall, how would you rate this course? (1–5)
- Q18. Would you recommend this course to other B.Tech students studying DBMS? (Yes / No / Maybe)
- Q19. What did you find most valuable about this course? (Open-ended)
- Q20. What improvements would you suggest for this course? (Open-ended)

Appendix B: Raw Data Summary

Summary statistics from survey responses (n = 38 respondents):

Q#	Parameter	Mean	Std. Dev.	Mode
Q1	Clarity of Concepts	4.4	0.62	5
Q2	Pacing & Length	4.1	0.75	4
Q3	Visual Quality	4.3	0.68	4
Q4	Audio/Video Quality	4.5	0.52	5
Q5	Engagement Level	3.9	0.83	4
Q6	Coverage Depth	4.2	0.71	4
Q7	Challenge Relevance	4.0	0.79	4
Q8	Difficulty Level	3.9	0.81	4
Q9	Instruction Clarity	3.8	0.85	4
Q10	Feedback Quality	3.7	0.90	4
Q11	Time Required	3.8	0.76	4
Q12	Hands-on Value	3.9	0.81	4
Q13	Tool Usability	3.7	0.92	4
Q14	Setup Ease	3.3	1.05	3
Q15	Troubleshooting Support	3.4	0.98	3
Q16	Theory Reinforcement	4.0	0.74	4
Q17	Overall Rating	4.0	0.73	4

Appendix C: Selected Student Comments

The following are anonymised representative comments from open-ended survey responses:

Most Valuable Aspects:

- “The SQL query demonstrations were extremely helpful. Watching the instructor type and run queries in real time made it much easier to understand than just reading about it.”
- “The normalisation section was the best I have seen. The step-by-step breakdown from 1NF to BCNF with worked examples finally made it click for me.”
- “The ER diagram explanations were very clear and the visual representations were easy to follow. The course covers everything we need for our DBMS exam.”
- “The challenges after each module were a good test of understanding. I liked that they were directly related to what was taught in the videos.”

Suggested Improvements:

- “The setup guide for MySQL was not detailed enough. I spent two hours trying to install it and couldn’t figure out the environment variables. A step-by-step video guide would help a lot.”
- “It would be great if the challenges showed detailed explanations for wrong answers, not just whether the answer was right or wrong.”
- “Some videos were a bit long. Breaking them into smaller 10–15 minute segments would make it easier to study in short sessions.”

Appendix D: Course Completion Certificate

The following Certificate of Excellence was awarded to Nandini Sharma upon successful completion of the Scaler Topics DBMS Course on 16 April 2026.
