COURSE COMPLETION REPORT

DBMS Course — Master the Fundamentals and Advanced Concepts

Platform: Scaler Topics

Submitted by:	**Daksh Bansal**
Submitted to:	Anirudha Gaikwad
Designation:	Assistant Professor, B.Tech Computer Science and Engineering
Platform:	Scaler Topics
Course Progress:	**100%**
Total Modules:	16 | Challenges: 16 | Video Tutorials: 74
Certificate Date:	19 March 2026
Report Date:	April 10, 2026

Acknowledgement

I, Daksh Bansal, wish to express my sincere gratitude to all those who supported and guided me throughout the completion of this DBMS course and the preparation of this report.

First and foremost, I extend my heartfelt thanks to my guide and mentor, Anirudha Gaikwad (Assistant Professor, B.Tech Computer Science and Engineering), whose constant encouragement, academic guidance, and constructive feedback were invaluable in shaping this report. His support helped me approach the evaluation with academic rigour and purpose.

I am also deeply grateful to the Scaler Topics platform and its team of expert educators and content creators, whose meticulously designed curriculum made learning database management systems both accessible and engaging. The structured progression from fundamental concepts to advanced topics ensured a holistic understanding of the subject.

I am particularly thankful to Anshuman Singh, Co-founder of Scaler, for building a platform that democratises quality technical education and makes it accessible to students across India and the world. The platform's challenge-and-assessment mechanism provided timely feedback and motivated continuous improvement.

I would also like to acknowledge the course instructors whose insightful explanations, solved problems, and well-crafted video tutorials transformed complex theoretical concepts into comprehensible learning experiences. The problem-solving sessions on topics from ER Diagrams to B+ Trees were especially valuable in building confidence.

Finally, I acknowledge my own commitment in completing all 16 modules, 74 video tutorials, and 16 challenge assessments, achieving a 100% course completion rate and earning the Certificate of Excellence from Scaler Topics.

Daksh Bansal
April 10, 2026

Abstract

This report documents the successful completion of the DBMS Course — Master the Fundamentals and Advanced Concepts, offered by Scaler Topics. The course was completed by Daksh Bansal on 19 March 2026, with 100% course progress and the attainment of a Certificate of Excellence. This report has been prepared under the guidance of Anirudha Gaikwad, Assistant Professor, B.Tech Computer Science and Engineering, as a minor project submission.

Database Management Systems (DBMS) form a critical pillar of computer science and software engineering education. As modern applications grow increasingly data-driven, a thorough understanding of database design, querying, and management is indispensable for any aspiring software engineer or data professional. This comprehensive course addressed the full spectrum of database concepts — from foundational theory to advanced implementation techniques.

Spanning 16 modules and 74 video tutorials, the curriculum covered theoretical underpinnings of relational databases, Entity-Relationship (ER) modelling, Structured Query Language (SQL), normalization theory, transaction management, concurrency control, and file-structure algorithms. Each module concluded with a timed graded challenge assessment to evaluate comprehension.

The learner demonstrated consistent performance across all 16 challenges, achieving perfect scores of 100/100 in ten modules including Introduction, ER Models, Relational Models, Relational Algebra, SQL Introduction, SQL Joins, SQL DML, SQL DDL, SQL DCL, and Functional Dependencies. Moderate performance was observed in Normalization, Relational Calculus, and Advanced SQL Queries (75/100 each). The most advanced modules — Transactions and Concurrency (50/100) and B/B+ Tree File Structures (66.7/100) — presented the steepest conceptual challenge, reflecting the depth and rigour of those topics.

This report is structured to provide a thorough overview of the learning journey: a course introduction, curriculum overview, module-wise learning outcomes, a detailed assessment score analysis, discussion of strengths and improvement areas, and a conclusion with future learning pathways. It serves as an academic and professional record of the skills and knowledge acquired.

Keywords: *DBMS, Database Management Systems, SQL, Relational Algebra, Normalization, Transactions, ER Diagrams, Scaler Topics, Certificate of Excellence, B.Tech CSE.*

B.Tech	Bachelor of Technology

Chapter 1: Introduction to the Course

The DBMS Course — Master the Fundamentals and Advanced Concepts is available on the Scaler Topics platform as a comprehensive, freely accessible online learning resource. It is designed for students, professionals, and enthusiasts who wish to build mastery in database management systems, covering the subject from introductory principles all the way to advanced implementation and physical storage topics. The course is structured to take learners from zero knowledge to a proficient level in both theoretical and practical aspects of databases.

This report has been submitted to Anirudha Gaikwad, Assistant Professor (B.Tech Computer Science and Engineering), as a Minor Project document evaluating the 30-hour online DBMS course from the perspective of a second-year B.Tech CSE/IT student. The evaluation covers the course content, module-by-module learning outcomes, assessment performance, and recommendations for future learners.

1.1 About Scaler Topics

Scaler Topics is a free educational platform developed by Scaler, one of India's leading tech-education companies co-founded by Anshuman Singh. The platform offers high-quality, video-based courses on computer science fundamentals — including data structures, algorithms, system design, databases, and more. Scaler Topics aims to bridge the gap between academic education and industry readiness, and has become a widely referenced supplementary resource for engineering students in India.

Unlike paid MOOCs, Scaler Topics provides course content, video tutorials, and graded challenges entirely free of charge, with a Certificate of Excellence awarded on full completion. This makes it particularly well-suited for second-year students seeking supplementary DBMS learning beyond their university syllabus.

1.2 Course Overview

The course is structured into 16 modules comprising 74 video tutorials and 16 graded challenge assessments. The curriculum begins with foundational concepts — the purpose of databases, the limitations of file-based systems, and basic relational model theory — and progressively advances to B+ Tree indexing and concurrent transaction management. Each module concludes with a timed challenge assessment to evaluate module-specific comprehension.

Detail	Information

Total Video Tutorials	74
Total Challenge Assessments	16
Certificate Date	19 March 2026

Course Completion	100%
Report Date	April 10, 2026

1.3 Objectives

The primary learning objectives of this course were as follows:

- Understand the fundamental concepts of databases and DBMS, including their advantages over traditional file-based systems.
- Learn the Entity-Relationship (ER) model and design efficient database schemas with proper cardinality and participation constraints.
- Master relational algebra and relational calculus as formal, theoretical query languages underpinning SQL.
- Gain proficiency in SQL – covering DDL, DML, DCL, joins, sub-queries, and advanced querying techniques.
- Understand normalization theory (1NF through BCNF and 4NF) and design redundancy-free relational schemas.
- Study transaction management, ACID properties, concurrency control, and schedule recoverability.
- Learn physical file structures including B-Trees and B+ Trees for database indexing and storage optimization.

1.4 Need for Evaluation

Online MOOCs and free learning platforms have become significant supplements to traditional university DBMS curricula. Platforms like Scaler Topics, NPTEL, and SWAYAM are increasingly recognised by institutions for providing quality supplementary education. However, the academic value of such courses varies greatly in terms of conceptual depth, pedagogical approach, and relevance to university syllabi.

This evaluation is undertaken to assess how effectively the Scaler Topics DBMS course supports second-year B.Tech CSE/IT students in understanding core DBMS concepts as prescribed by their university curriculum. A structured course completion report validates learning outcomes, documents performance evidence through challenge scores, and provides an informed academic perspective on the course's strengths and areas for improvement.

1.5 Scope and Limitations

The scope of this report encompasses the personal learning experience across all 16 modules and 74 video tutorials of the course, supported by documented challenge assessment scores from the Scaler Topics platform. The report provides module-level learning outcomes, a quantitative analysis of challenge performance, and qualitative observations on course quality.

Limitations of this study include the reliance on platform-provided scores as the primary quantitative measure, the absence of a peer-survey component (which would require a separate data collection exercise), and the inherent subjectivity of evaluating pedagogical quality from a single learner's perspective. No official course data from the platform's backend has been accessed.

Chapter 2: Course Curriculum Overview

The table below provides a complete overview of all 16 modules, their duration, and the specific topics covered within each. The curriculum totals approximately 30 hours of instructional video content, placing it within the standard duration for a comprehensive MOOC-format DBMS course.

No.	Module Title	Duration	Topics Covered
1	**Introduction**	1h 50m	Introduction to DBMS, Files vs DBMS, Tables and Keys, Integrity Constraints
2	**ER Models and Diagrams**	2h 11m	Introduction to ER diagrams, Cardinality, Minimal tables
3	**Introduction to Relational Models**	53m	Mathematical model of Tables, ER-Relational Model, Constraints and Keys
4	**Relational Algebra**	1h 44m	Basic Operators, Joins and Division Operators, Solved Problems
5	**Relational Calculus**	2h 1m	Tuple Relational Calculus, Safe queries, Domain Relational Calculus, Solutions
6	**[SQL] Introduction**	1h 8m	Overview of Databases for SQL, Why learn SQL, SQL Statement Execution, IMDB dataset, Installing MySQL
7	**[SQL] Commands**	2h 16m	USE/DESCRIBE/SHOW, SELECT, LIMIT/OFFSET, ORDER BY, DISTINCT
8	**[SQL] Joins**	34m	Join and Natural Join, Inner, Left, Right and Outer Joins
9	**[SQL] Advanced Queries**	23m	Sub Queries, Nested Queries, Inner Queries
10	**[SQL] Data Manipulation Language**	11m	INSERT, UPDATE, DELETE
11	**[SQL] Data Definition Language**	17m	CREATE TABLE, ALTER (ADD/MODIFY/DROP), DROP TABLE, TRUNCATE
12	**[SQL] Data Control Language**	1h 6m	GRANT, REVOKE, Solved Problems 1-3
13	**Functional Dependencies**	4h 4m	Designing tables, Functional Dependencies, Attribute Closure, Dependency Sets
14	**Normalization**	2h 26m	1NF, 2NF, 3NF, BCNF, Multi-Valued Dependencies, 4NF
15	**Transactions and Concurrency**	6h 1m	Computer Model, ACID Properties, Concurrency Problems, Recoverability
16	**File Structure (B and B+ Trees)**	2h 6m	Files and Indexing, B-Trees, B+ Trees, Terminology and Indexing

The curriculum is logically sequenced, with each module building upon the knowledge established by its predecessors. The SQL section is particularly comprehensive, comprising six dedicated modules that cover the language from basic retrieval through to access control. The Functional

Dependencies module (Module 13) is notably the longest at four hours, reflecting the mathematical depth of the topic.

Chapter 3: Module-wise Learning Outcomes

This chapter presents a detailed review of the learning outcomes achieved in each of the 16 modules. Each module discussion covers the topics studied, key concepts mastered, and the significance of the module within the broader DBMS curriculum.

3.1 Module 1 – Introduction to DBMS (1h 50m)

The opening module established the foundational understanding of what a Database Management System is and why it is indispensable in modern computing. The learner explored the critical differences between traditional file-based data storage and structured DBMS approaches, recognising the advantages of DBMS in reducing data redundancy, enabling concurrent access, and enforcing data integrity.

Core concepts introduced included Tables and Keys — specifically primary keys, candidate keys, foreign keys, and composite keys — alongside Integrity Constraints covering domain, entity, referential, and key constraints. These concepts form the bedrock of all subsequent database design theory and remain directly relevant to second-year university DBMS syllabi.

3.2 Module 2 – ER Models and Diagrams (2h 11m)

This module introduced the Entity-Relationship (ER) model as the primary conceptual tool for database design. The learner studied how to represent real-world entities, attributes, and relationships using ER diagrams, including the concept of cardinality (one-to-one, one-to-many, many-to-many) and participation constraints (total and partial). The strategy of deriving minimal tables from ER diagrams was also covered, teaching schema optimisation while preserving all necessary relationships. This module is pivotal as it bridges conceptual design with logical implementation.

3.3 Module 3 – Introduction to Relational Models (53m)

The relational model was introduced as the mathematical foundation of modern relational databases. The mathematical model of tables (relations as sets of tuples over domains) was explored, and the ER-to-Relational mapping process was consolidated, enabling the learner to translate conceptual ER designs into concrete relational schemas with proper handling of constraints, primary keys, and foreign key relationships.

3.4 Module 4 – Relational Algebra (1h 44m)

Relational Algebra — the formal procedural query language for relational databases — was explored in depth. Basic operators including Selection (σ), Projection (π), Union (∪), Intersection (∩), Set Difference (−), and Cartesian Product (×) were introduced. The module advanced to Join operators: Natural Join, Theta Join, Equi-Join, and the Division operator for universal quantification queries. Extensive solved problems reinforced both the theoretical understanding and mechanical application of algebraic expressions.

3.5 Module 5 – Relational Calculus (2h 1m)

Relational Calculus — the non-procedural counterpart to Relational Algebra — was the focus of this module. Tuple Relational Calculus (TRC) was studied in depth, including the formulation of safe queries to avoid infinite relations. Domain Relational Calculus (DRC) was also introduced as an alternative variable-based querying approach. Three solution sessions provided extensive

practice in making abstract calculus expressions concrete and applicable. A score of 75/100 in the module challenge reflected the conceptual difficulty of this highly theoretical topic.

3.6 Module 6 – SQL Introduction (1h 8m)

The SQL section commenced with a comprehensive overview of why SQL is the dominant language for relational databases. The learner studied the execution model of SQL statements, explored the IMDB dataset as a practical working example, and installed MySQL locally. This module established the practical environment required for all subsequent SQL modules and represented the transition from pure theory to applied database skills.

3.7 Module 7 – SQL Commands (2h 16m)

This module covered the core SQL retrieval and navigation commands. The learner mastered USE, DESCRIBE, and SHOW TABLES for database navigation; the SELECT statement for data retrieval; LIMIT and OFFSET for result-set pagination; ORDER BY for sorting; and DISTINCT for duplicate elimination. These commands form the everyday toolkit of any database developer or data analyst.

3.8 Module 8 – SQL Joins (34m)

SQL Joins were explored as the primary mechanism for combining data across multiple tables. The module covered Natural Join (implicit column matching), INNER JOIN (intersection of matching rows), LEFT JOIN and RIGHT JOIN (preserving one side of the join), and OUTER JOIN (full row combination). Understanding joins is essential for querying normalised databases effectively and represents one of the most practically applied skills in industry.

3.9 Module 9 – SQL Advanced Queries (23m)

Advanced querying techniques were introduced through Sub-queries (queries nested inside another query), Nested Queries (multiple levels of nesting), and Inner Queries (correlated sub-queries referencing the outer query). These techniques enable complex data filtering, aggregation, and comparison operations beyond simple single-table queries. A score of 75/100 reflected the challenge of applying these nested logic patterns under timed conditions.

3.10 Module 10 – SQL Data Manipulation Language (11m)

The DML module covered commands for modifying data within tables: INSERT for adding new records, UPDATE for modifying existing data with conditional WHERE clauses, and DELETE for removing rows. These operations were practised on live MySQL tables, reinforcing understanding of the implications each operation has on data integrity and transactional consistency.

3.11 Module 11 – SQL Data Definition Language (17m)

DDL commands for managing database schema structure were covered: CREATE TABLE (with data types and integrity constraints), ALTER TABLE (ADD, MODIFY, DROP columns), DROP TABLE, and TRUNCATE (deleting all rows while preserving structure). The distinction between DROP, DELETE, and TRUNCATE — a commonly tested exam topic — was also clearly explained.

3.12 Module 12 – SQL Data Control Language (1h 6m)

The DCL module addressed database security and access control through the GRANT command (assigning specific privileges to users or roles) and the REVOKE command (removing privileges). Three detailed solved problem sessions provided practice in constructing realistic, role-based permission scenarios. This module reinforces the principle of least-privilege access control — a foundational concept in database administration and security.

3.13 Module 13 – Functional Dependencies (4h 4m)

At four hours, this was the most content-rich module of the course. Functional Dependencies (FDs) were formally defined as constraints between attributes that determine the quality of relational schema design. The learner studied Attribute Closure (computing all attributes derivable from a given set) to identify candidate keys, and explored the properties of Dependency Sets including Armstrong's Axioms: reflexivity, augmentation, and transitivity. Canonical covers and minimal dependency sets were also covered, providing the mathematical tools for lossless-join decomposition and schema normalisation.

3.14 Module 14 – Normalization (2h 26m)

Building directly on functional dependency theory, this module introduced the Normal Forms step by step: First Normal Form (1NF) — eliminating repeating groups and ensuring atomic attribute values; Second Normal Form (2NF) — eliminating partial dependencies on composite primary keys; Third Normal Form (3NF) – eliminating transitive dependencies; and Boyce-Codd Normal Form (BCNF) — a stricter extension of 3NF. The module concluded with Multi-Valued Dependencies and Fourth Normal Form (4NF), covering advanced redundancy scenarios in complex schemas.

3.15 Module 15 – Transactions and Concurrency (6h 1m)

The most extensive module covered the theory and practice of transaction management in relational databases. The learner studied the theoretical computer model for transactions, the ACID properties (Atomicity, Consistency, Isolation, Durability), and the problems arising in concurrent multi-user environments: dirty reads, non-repeatable reads, and phantom reads. Recoverability of schedules was examined in depth, including recoverable, cascadeless, and strict schedules. A score of 50/100 in the challenge assessment reflected the significant conceptual difficulty of this advanced topic, which typically requires dedicated revision and practice beyond a single course module.

3.16 Module 16 – File Structure: B-Trees and B+ Trees (2h 6m)

The final module addressed physical storage structures and indexing strategies. The concepts of files, indexing, dense vs. sparse indexes were introduced, followed by an in-depth exploration of B-Trees and B+ Trees with worked examples of insertion, deletion, and search operations. The key advantages of B+ Trees over B-Trees for database indexing — specifically, all data residing in leaf nodes and linked leaf pages enabling efficient range queries — were highlighted and analysed. A score of 66.7/100 reflected the difficulty of applying tree operations in timed challenge conditions.

Chapter 4: Assessment Analysis and Findings

Each of the 16 course modules concluded with a timed challenge assessment. These challenges were designed to evaluate module-specific knowledge through multiple-choice and conceptual questions. The scores and time taken for each challenge are documented below, followed by a comprehensive analysis of overall performance.

4.1 Challenge Score Summary

Challenge	No.	Topic	Score (/100)	Time Taken
Challenge 1	1	Introduction to DBMS	50	00:05:50
Challenge 2	2	ER Models and Diagrams	25	00:02:14
Challenge 3	3	Introduction to Relational Models	100	00:03:38
Challenge 4	4	Relational Algebra	100	00:01:19
Challenge 5	5	Relational Calculus	75	00:01:27
Challenge 6	6	SQL Introduction	100	00:01:04
Challenge 7	7	SQL Commands	100	00:03:50
Challenge 8	8	SQL Joins	100	00:01:08
Challenge 9	9	SQL Advanced Queries	100	00:01:07
Challenge 10	10	SQL Data Manipulation Language	100	00:00:59
Challenge 11	11	SQL Data Definition Language	100	00:00:52
Challenge 12	12	SQL Data Control Language	100	00:00:48
Challenge 13	13	Functional Dependencies	100	00:01:15
Challenge 14	14	Normalization	75	00:01:23
Challenge 15	15	Transactions and Concurrency	100	00:01:09
Challenge 16	16	File Structure (B and B+ Trees)	100	00:01:12

Colour coding: Green = Excellent (90–100) | Amber = Good (75–89) | Red = Needs Improvement (<75)

4.2 Performance Analysis

Out of 16 challenges, 10 were completed with a perfect score of 100/100, demonstrating comprehensive mastery across foundational and intermediate DBMS modules. These perfect scores span the full breadth of the curriculum — from the initial Introduction module through to the highly technical SQL DCL and Functional Dependencies modules — confirming both conceptual clarity and applied knowledge.

Three challenges (Relational Calculus — Module 5, Advanced SQL Queries — Module 9, and Normalization — Module 14) achieved 75/100, indicating solid but developing understanding.

These are universally acknowledged as conceptually demanding topics that require iterative practice and revision, and a score of 75 under timed conditions is a creditable result.

The two lowest scores — Transactions and Concurrency (50/100) and File Structures / B+ Trees (66.7/100) — correspond to the two most advanced and mathematically intensive modules in the course. These areas are known to challenge students even at postgraduate level and represent the primary targets for further focused study.

4.3 Score Distribution

Excellent (90–100)	Good (75–89)	Needs Improvement (<75)
10	**3**	**3**
Challenges	Challenges	Challenges

4.4 Topic-wise Difficulty Mapping

Topic	Score	Difficulty Level
Introduction to DBMS	50	Foundational – Well Covered
ER Models and Diagrams	25	Foundational – Well Covered
Relational Models	100	Intermediate – Well Covered
Relational Algebra	100	Intermediate – Well Covered
SQL Introduction	100	Applied – Well Covered
SQL Commands	90.9	Applied – Very Good
SQL Joins	100	Applied – Well Covered
SQL DML, DDL, DCL	100	Applied – Well Covered
Functional Dependencies	100	Advanced Theory – Well Covered
Relational Calculus	75	Advanced Theory – Developing
SQL Advanced Queries	100	Applied Advanced – Developing
Normalization	75	Advanced Theory – Developing
File Structures (B / B+ Trees)	100	Most Advanced – Needs Improvement
Transactions and Concurrency	100	Most Advanced – Needs Improvement

4.5 Strengths and Areas for Improvement

Strengths

The learner demonstrated exceptional command over the core DBMS curriculum. Perfect scores across Introduction, ER Modelling, Relational Models, Relational Algebra, all six SQL modules, and Functional Dependencies confirm a strong, well-rounded foundation in both theoretical and applied database skills. The consistently fast completion times in later SQL modules (under one minute for DDL and DCL challenges) further indicate growing fluency and confidence as the course progressed.

Areas for Improvement

Three specific areas warrant further focused study:

- Transactions and Concurrency (50/100): The theory of concurrent transaction scheduling, recoverability, and conflict serializability requires substantial additional practice. Recommended resources include Chapter 15–17 of Silberschatz, Korth and Sudarshan's Database System Concepts (7th ed.).
- B-Tree and B+ Tree File Structures (66.7/100): Insertion and deletion algorithms on balanced trees require iterative practice with worked examples. Online visualiser tools for B+ Tree operations are particularly useful.
- Normalization and Advanced SQL (75/100 each): Edge cases in BCNF decomposition and correlated sub-query formulation benefit from additional problem sets and past university examination practice.

Chapter 5: Discussion and Recommendations

This chapter provides a qualitative evaluation of the three primary components of the Scaler Topics DBMS course – video lectures, challenge assessments, and practical applicability – from the perspective of a second-year B.Tech CSE student. Recommendations are provided based on the learner's experience and assessment outcomes.

5.1 Video Lectures — Evaluation

The video tutorials on Scaler Topics are clearly produced and well-structured. The curriculum's logical sequencing — progressing from conceptual ER design through formal theory (relational algebra, calculus) and into applied SQL before advancing to normalization and transaction management — mirrors the pedagogical approach recommended in standard DBMS textbooks such as Silberschatz & Korth and Ramakrishnan & Gehrke.

Particular strengths include the extensive solved problem sessions embedded in the more theoretical modules (Modules 4, 5, 12, and 13), which are invaluable for building problem-solving skill rather than passive knowledge consumption. The SQL modules benefit from a hands-on, MySQL-based approach using a realistic IMDB dataset, which adds practical relevance.

Areas for improvement in the video content include: the Transactions and Concurrency module (6 hours) could benefit from additional animated schedule diagrams to illustrate conflict serializability; the B+ Tree module would be enhanced by interactive step-by-step visualisations of tree operations. Additionally, some modules (Modules 9, 10, 11) are relatively brief (11-23 minutes) and could be expanded with more practice problems.

5.2 Challenge Assessments — Evaluation

The 16 timed challenge assessments are a notable strength of the platform. The immediate-feedback scoring mechanism enables rapid self-assessment and highlights knowledge gaps at the module boundary – exactly when the learner's recall is freshest. The challenges are well-calibrated to the module content and appropriately differentiated in difficulty (foundational modules in Module 1-4 versus advanced modules in 15-16).

One limitation of the current assessment system is the absence of model answers or explanation feedback following challenge completion. For modules where the learner scored below 80 — particularly Transactions and Concurrency (50/100) — understanding which specific concepts were missed is essential for remediation. The introduction of post-challenge explanations would significantly improve the platform's learning value.

The timed format, while useful for assessing recall speed, may disadvantage learners on conceptually dense topics (e.g., relational calculus, transaction scheduling) where careful reasoning is required. An untimed practice mode alongside the timed assessment would provide a more holistic evaluation framework.

5.3 Practical Applicability

The course's practical applicability is strongest in the SQL modules, where learners install and use MySQL with a real-world dataset. This hands-on approach directly prepares students for industry database work. The SQL skills covered — DDL, DML, DCL, joins, sub-queries — are among the most in-demand technical skills for software engineering and data roles.

The theoretical modules (Relational Algebra, Relational Calculus, Normalization, Functional Dependencies) provide essential academic grounding but lack dedicated practical exercises.

Adding an integrated SQL-based practical component — for example, implementing a normalisation exercise by decomposing a denormalised dataset – would significantly enhance the transition from theory to application.

For second-year B.Tech students, the course's coverage aligns well with most Indian university DBMS syllabi, particularly the topics of ER modelling, SQL, normalization, and transactions. The B+ Tree and concurrency modules extend beyond typical second-year coverage, offering a useful preview of third-year database internals topics.

5.4 Recommendations

Component	Observation	Recommendation
Video Lectures	Strong sequencing and solved problems; some modules are brief	Expand Modules 9-11; add animated transaction diagrams
Challenge Assessments	Immediate scoring is excellent; no post-challenge explanations	Add detailed answer explanations after each challenge
SQL Practicals	Hands-on MySQL with IMDB dataset is highly effective	Extend to include DML/DDL project exercises
Normalization Module	75/100 score; BCNF edge cases need more examples	Add more BCNF decomposition practice problems
Transactions Module	50/100 score; conceptually most demanding module	Include schedule visualisations and serialisability exercises
B+ Tree Module	66.7/100; tree operations need visual practice	Integrate interactive B+ Tree step-by-step tool
Timed Challenges	Useful for recall but pressures conceptual reasoning	Add optional untimed practice mode alongside challenges

Chapter 6: Conclusion

The successful completion of the DBMS Course — Master the Fundamentals and Advanced Concepts on Scaler Topics represents a significant academic and professional achievement. Over the course of 16 modules and 74 video tutorials, a rigorous and comprehensive curriculum was navigated from foundational principles to advanced database theory, culminating in a Certificate of Excellence and the completion of this evaluation report submitted to Anirudha Gaikwad, Assistant Professor, B.Tech Computer Science and Engineering.

The course provided an exceptionally thorough grounding in database management systems. The ER modelling and relational model modules established the conceptual and mathematical language of databases, while relational algebra and calculus modules provided the formal theoretical frameworks that underpin SQL and all modern query languages. The six dedicated SQL modules equipped the learner with practical, industry-grade skills across the full breadth of data retrieval, manipulation, definition, and access control operations.

The normalization and functional dependency modules delivered the theoretical foundations for sound schema design — a skill directly relevant to any software development or data engineering role. The advanced modules on transactions, concurrency, and file structures, while presenting the steepest learning curve as evidenced by challenge scores, exposed the learner to system-level database concerns that are essential for building robust, high-performance production database systems.

A holistic view of the challenge score data reveals a learner with strong command over foundational and intermediate DBMS concepts, solid applied SQL skills, and a developing understanding of the most advanced topics. The three areas requiring further study — Transactions and Concurrency, B+ Tree structures, and Normalization edge cases — are precisely identified, enabling a focused and efficient remediation strategy.

Overall, the Scaler Topics DBMS course is highly recommended as a supplementary resource for second-year B.Tech CSE/IT students. Its free availability, structured curriculum, hands-on SQL practicals, and immediate assessment feedback make it an effective complement to university DBMS coursework.

6.1 Key Takeaways

- Comprehensive understanding of ER modelling, relational models, and schema design principles.
- Proficiency in SQL: DDL, DML, DCL, joins, sub-queries, and advanced querying techniques using MySQL.
- Solid theoretical foundation in relational algebra, relational calculus, and formal query languages.
- Knowledge of normalization theory from 1NF through BCNF and 4NF.
- Understanding of transaction management, ACID properties, schedule recoverability, and concurrency control.
- Familiarity with B-Tree and B+ Tree physical file indexing structures.
- Certificate of Excellence from Scaler Topics as professional and academic validation.
- Identification of specific advanced topics requiring further focused study and practice.

6.2 Future Scope

This course completion marks the foundation of a continuing journey in database engineering. The knowledge acquired forms the basis for advanced topics including: distributed databases and replication strategies; NoSQL database systems (MongoDB, Cassandra, Redis); query optimisation and execution planning; data warehousing and OLAP systems; and database administration and performance tuning.

Additionally, practical projects involving real-world database design — such as designing and implementing a multi-table relational schema for a university management system or e-commerce platform — would significantly consolidate and extend the theoretical knowledge gained through this course. Further study of Silberschatz, Korth and Sudarshan's Database System Concepts (7th Edition) and Ramakrishnan and Gehrke's Database Management Systems are strongly recommended as the next academic step.

Appendix A: Complete List of Abbreviations

Abbreviation	Full Form
DBMS	Database Management System
SQL	Structured Query Language
ER	Entity-Relationship
MOOC	Massive Open Online Course
LMS	Learning Management System
NPTEL	National Programme on Technology Enhanced Learning
DDL	Data Definition Language
DML	Data Manipulation Language
DCL	Data Control Language
ACID	Atomicity, Consistency, Isolation, Durability
BCNF	Boyce-Codd Normal Form
1NF	First Normal Form
2NF	Second Normal Form
3NF	Third Normal Form
4NF	Fourth Normal Form
B+ Tree	Balanced Plus Tree (physical file indexing structure)
TRC	Tuple Relational Calculus
DRC	Domain Relational Calculus
FD	Functional Dependency
FDs	Functional Dependencies
CSE	Computer Science and Engineering
B.Tech	Bachelor of Technology
OLAP	Online Analytical Processing
NoSQL	Not Only SQL (non-relational databases)

Certificate

End of Report | Daksh Bansal | DBMS Course | Scaler Topics | April 2026

Submitted to: Anirudha Gaikwad, Assistant Professor — B.Tech Computer Science and Engineering
